CHE 396 SENIOR DESIGN HOMEWORK ASSIGNMENT 6

Ethics /Sustainability Case Assignment

Your goal for this assignment is to identify an ethical case, describe it and analyze course of actions in written and oral format. You need to submit a written report and there will be 10-minute oral presentation in the class on December 1st and 3rd.

You should start choosing an ENGINEERING ethical/sustainability case. This could include issues such as privacy, public safety, intellectual property, product liability, applicable laws or ethical guidelines (like those protecting human subjects participating in research) that need to be considered, issues relating to how the team works together, responsibilities to project sponsors, local communities, etc. Case might be a real case or adopted case or imaginary case. (Do not forget to cite!)

1. You need to state the problem clearly. What are the ethical and sustainability issues raised? What are some of the concerns surrounding your topic? What are the surrounding details that complicate this situation? Who are the stakeholders involved? What laws, guidelines or other standards govern? How major problems or questions in this area should be addressed? Who will be affected by your decision?

2. Choose two different course of actions for your case. Explain these course of actions. Include both benefits and consequences of each. Justify each course of action in ethical context. At your oral presentation, your group should be divided into two subgroups. Each subgroup will be defending one of these course of actions. Your reasoning should be based on code of professional ethics (http://www.aiche.org/about/code-ethics). You need to analyze sustainability of your action. If it is a product/process, sustainability analysis should include carbon footprint and life cycle analysis. If it is related to communication/teamworking/company culture, please analyze social justice impact.
