

Q1-2.)

I-Clicker question: Which change cannot increase the rate $-r_A$?

- a) Raise Temp
- b) use Better cat.
- c) Switch to better type reactor
- d) Change solvent in liquid phase reaction.

I think this is a good question Because it makes us think conceptually.

I-Clicker question: Which compound is the Limiting reactant

$$N_{A0} = 4 \text{ moles}$$

$$N_{B0} = 7 \text{ moles}$$

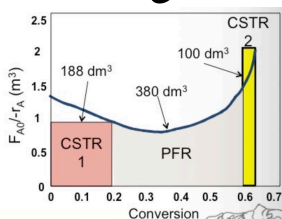

$$N_{C0} = 9 \text{ moles}$$

This would be a good starter for a multiple Part question.

I-Clicker question: describe a better conversion given the graph.

- A. Switch CSTR 1 and PFR
- B. Switch CSTR 1 and CSTR 2
- C. Switch PFR and CSTR 2
- D. Leave them the way they are

This would be good to understand how ordering reactors would be important

I-clicker: which is most likely to be an elementary rxn?

This wouldn't be a good question because it seems to much like chemistry instead of engineering.

I-clicker: compare the volumes of two CSTR'S in series based on the setup.

This would be a good question because it makes us think about CSTRS in series conceptually.

Q1-5.)

The content of this course is the fundamental difference between Chemical Engineers & other Engineers. It is the study of all chemical manufacturing. The website holds key topics, games, live interactive problems, and python code to help learn & solve chemical reaction problems

P1-5.) E, none of the equations have feed inputs matching feed outputs components for equation A, & B.
